Contents

Part I	1
1 Slow Reflection, Jump-returns, & Short-term Interest Rates	3
1.1 Introduction and motivation	5
1.2 Slowly-reflecting Brownian motion	6
1.3 Slowly-reflecting Ornstein-Uhlenbeck process	13
1.4 Diffusions with a delayed jump-start	15
1.5 Diffusions with jump-returns from a boundary	20
1.6 Example: CIR bond process with jump-returns from 0	30
1.7 Appendix – Proof of Theorem 1.2 (pole cancellation).	35
2 Spectral Theory for Jump-diffusions	37
2.1 Introduction and summary	38
2.2 Spectral asymptotics – the drum problem	45
2.3 Tips and tricks	54
2.4 Further discussion of exit problem setups	55
2.5 PIDE numerics without the pain (Part 1)	59
2.6 The finite-dimensional spectral expansion	77
2.7 PIDE (spectral) numerics without the pain (Part 2)	79
2.8 Characterizing the spectrum	99
2.9 Appendix – Bounded operators, closed operators	106
2.10 Appendix – Compact operators	107
3 Joint Time Series Modelling of SPX and VIX	115
3.1 Introduction and summary	116
3.2 A class of models: jumps by stochastic time-change	116
3.3 The probability transition density after the time change	118
3.4 The generator and characteristics after the time change	120
3.5 The probability transition density for the base model	121
3.6 The jump size distribution	122
3.7 The risk-neutral evolution and VIX	124
3.8 Estimates	126
3.9 The instantaneous conditional equity risk premium	128
3.10 Conclusions	131
3.11 Appendix – Mathematica code for the log-likelihood	135
4 Modelling VIX Options (and Futures) under Stochastic Volatility	143
4.1 Introduction and summary	144
4.2 VIX option formula summary for the AJD-1 model class	147

4.3	Basic reference formulas	148
4.4	VIX construction, settlement, and the idealized VIX	149
4.5	Option-implied forward prices	153
4.6	The VIX futures upper bound (& convexity adjustment)	156
4.7	A look at my option data	157
4.8	Why volatility jump-diffusions?	166
4.9	VIX option pricing under affine jump-diffusions	168
4.10	Calibration results.	178
4.11	Put-call parity and the VIX lower bound revisited	179
4.12	AJD-1: square-root process with positive jumps	180
4.13	VIX-related stationary densities under AJD modelling	187
4.14	AJD-1 and OU-Lévy model solutions	192
4.15	Equity (SPX) option values under AJD driving processes	194
4.16	Appendix – VIX option pricing under the OU-Lévy class	200
4.17	Appendix – Experienced returns to VIX futures/related ETF’s	201
4.18	Appendix – Expected returns to VIX futures/related ETF’s	211
4.19	Appendix – Equity VIX’s	219
4.20	Appendix – Other issues: scheduled jumps	224
4.21	Appendix – Oct 1, 2008 closing VIX option quotes	226
4.22	Appendix – Further background on the VIX construction	227
4.23	Appendix – Mathematica calibration codes	230
5	Stochastic Volatility as a Hidden Markov Model	241
5.1	Introduction and summary	242
5.2	Basic and two-level HMM probabilistic structures	244
5.3	The HMM discretization	246
5.4	The n -step transition density matrix	252
5.5	Latent state (volatility) inference	254
5.6	Mathematica implementation	258
5.7	Discussion of results	263
5.8	Bootstrap sampling distributions for parameter estimates	272
5.9	Appendix – Related structures/terminologies: MRW’s, MAP’s	275
5.10	Appendix – Mathematica Code: HMM.SVP.nb	276
5.11	Appendix – The recursion for the log-likelihood	292
5.12	Appendix – More detail on data and results.	293
6	Continuous-time Inference:	
	Mathematical Methods and Worked Examples	295
6.1	Introduction and overview	296
6.2	Local martingale limits	302
6.3	Likelihood ratios: basic principles	305
6.4	Inference under slowly-reflecting diffusions.	308
6.5	MLE when $b = \vec{\theta} \cdot \vec{\beta}$ and no boundary processes	312
6.6	Inference under the Ornstein-Uhlenbeck (OU) process	315
6.7	General methods for the bias and sampling distributions	319
6.8	Inference under Feller’s square-root process	321
6.9	Appendix – More on slowly-reflecting diffusions	330
6.10	Appendix – Slowly-reflecting BM: occupation time density	334

6.11	Appendix – An interesting constant related to Brownian motion . . .	336
6.12	Appendix – Martingale criteria of Mijatović and Urusov	340
6.13	Appendix – Square-root process with two killing terms	345
7	A Closer Look at the Square-root and 3/2-Model	347
7.1	Introduction	348
7.2	Feller’s square-root process	348
7.3	The flux	350
7.4	Two fundamental solutions	350
7.5	Derivation of G_{abs} and G_{ref}	352
7.6	Spectral expansions	355
7.7	The conservation of probability.	357
7.8	General solutions with specified flux at the origin	358
7.9	Application: Joint transition density in the Heston model	363
7.10	Application: Joint transition density for the 3/2-model	367
7.11	Application: CIR bond process, but with absorption	370
7.12	Appendix – Mathematica for the Heston model joint pdf	371
8	A Closer Look at the SABR Model	373
8.1	Introduction and summary	374
8.2	Global properties of the SABR process	375
8.3	The pseudo-MAP structure of the SABR process	376
8.4	The martingale defect when $\beta = 1$ and $\rho > 0$	381
8.5	Heuristic proof of the SABR martingality theorem	382
8.6	The SABR process transition density	383
8.7	The McKean formula	384
8.8	Finite-time absorption with general β	387
8.9	Ultimate absorption with general β (Analytics)	388
8.10	Finite-time absorption with $\beta = 0$ (Analytics)	390
8.11	Lognormal SABR: the $\text{BM}(\mathbb{H}^3)$ -related transition density	394
8.12	Lognormal SABR: fundamental transform solution	399
8.13	Lognormal SABR: fundamental transform derivation	405
8.14	Epilog: Making SABR work for equities (jumps, etc).	410
8.15	Appendix – Proof of the $\text{BM}(\mathbb{H}^3)$ -related SABR solution	411
9	Back to Basics: An Update on the Discrete Dividend Problem	413
9.1	Introduction and overview	414
9.2	Escrowed dividend models	415
9.3	Piecewise GBM models	417
9.4	Mathematica approach via <code>NDSolve</code> , using <code>WhenEvent</code>	419
9.5	Tree approaches	427
9.6	Put critical boundary shapes: standard cases	429
9.7	The perpetual American put under discrete dividends	435
9.8	Application of the <code>NDSolve</code> method to Stefan-type problems	441
9.9	Appendix – <code>C</code> code: put + binomial tree + discrete dividends	450
10	PDE Numerics without the Pain	453
10.1	Introduction	454
10.2	Two bond price solutions under the square-root process	454

10.3	Option values by the PDE-Fourier hybrid method	465
10.4	Solving steady-state (elliptic) problems using <code>NDSolve</code>	466
10.5	More tips when using <code>NDSolve</code>	466
11	Exact Solution to Double Barrier Problems under a Class of Processes	467
11.1	Introduction	468
11.2	Overshoot behavior	472
11.3	Fundamental transform identity.	475
11.4	Wiener-Hopf factorization	476
11.5	Truncation-by-A operation	481
11.6	Final solution steps	488
11.7	Appendix – Mathematica code and Laplace inversion	491
12	Advanced Smile Asymptotics: Geometry, Geodesics, and All That	497
12.1	CEV(p)-vol universality class	498
12.2	Metrics, geodesics, and distance functions	498
12.3	Varadhan’s heat kernel asymptotics	502
12.4	The asymptotic smile in stochastic volatility models	503
12.5	Some coordinate transformations	506
12.6	The eikonal scaling solution	509
12.7	Properties of the eikonal scaling solution	510
12.8	Geometry of the CEV(p)-vol model	514
12.9	Quasi-analytic solution ($\rho = 0$)	523
12.10	Quasi-analytic solution (general ρ)	526
12.11	Appendix – Motivating Varadhan’s relation (12.11)	539
12.12	Appendix – Meaning of the Christoffel symbols	540
12.13	Appendix – Visualization through embedding	541
12.14	Appendix – Gauss-Bonnet formula	545
12.15	Appendix – Series solution radius of convergence	550
	Part II Selected earlier writings	553
13	Applications of Eigenfunction Expansions in Continuous-time Finance	555
13.1	Introduction	555
13.2	Options on stocks with a constant dollar dividend rate	556
13.3	Term structure of interest rates	573
13.4	Summary and extensions	577
13.5	Appendix A – Proof of Proposition 13.1	578
13.6	Appendix B – Proof of Proposition 13.2	580
13.7	Appendix C – Proof of Proposition 13.5	582
14	A Simple Option Formula for General Jump-diffusion and Other Exponential Lévy Processes	585
14.1	Introduction and summary	586
14.2	Background	587

14.3	Examples of Lévy processes	591
14.4	The option formula	593
14.5	Contour variations	596
14.6	Conclusions	598
14.7	Notes	599
15	Asian Connections	601
15.1	The PDE of Rogers and Shi	602
15.2	Comparing the two problems	603
15.3	Reduction of the Asian option problem to a half-line	604
15.4	Hitting time distribution	605
15.5	The call option formula as a transform	606
15.6	The call option formula after the inversion	607
15.7	Computations	610
16	Fear of Jumps	611
16.1	Introduction	611
16.2	Market snapshot	612
16.3	Merton's jump-diffusion model	614
16.4	Better risk adjustment	615
16.5	Risk adjustment examples	617
16.6	Exponential Lévy processes	619
16.7	A formula for option values	620
17	Perpetual American Options Made Easy	623
17.1	Introduction	623
17.2	Background: the random walk case	624
17.3	Continuous-time (Lévy process) case	628
18	American Options under Jump-diffusions: An Introduction	635
18.1	Introduction	635
18.2	The problem	636
18.3	Small-time behavior	637
18.4	Large-time behavior	638
18.5	Put/call duality	638
18.6	Basic explicit lattice algorithms	639
18.7	More efficient schemes	642
19	Barrier Options under Jump-diffusions I: Analytic Theory	645
19.1	Introduction	645
19.2	General solution	646
19.3	No negative jumps	650
19.4	No positive jumps	651
19.5	Point jumps: A numerical experiment	651
20	Barrier Options under Jump-diffusions II: One-Touch Options	657
20.1	Introduction	657
20.2	Down-and-out call with a rebate	658
20.3	One-touch option	658

20.4	The negative point jump conjecture	662
20.5	Some details of the algorithm	664
21	American-style Options with One-sided Jumps	665
21.1	Introduction	665
21.2	Two European-style payoffs we need	665
21.3	American-style options	667
21.4	The numerical method	669
22	Volatility Jump-diffusions	673
22.1	A class of stock price models	673
22.2	Adjoint operator	674
22.3	Parameterized class of models	676
22.4	Stationary transition density	677
22.5	The square-root jump-diffusion model	679
22.6	The GARCH jump-diffusion model	680
23	Double Barrier Problems with Jumps: A Simple “Universal” Algorithm	687
23.1	The problem	687
23.2	The algorithm	688
23.3	Examples	690
23.4	Conclusions	691
24	Diffusions, Jumps, and the Distribution of the Maximum	693
24.1	General setting	693
24.2	Maximum problem	695
24.3	Laplace transform version	697
24.4	Example	698
24.5	Appendix: Monte Carlo code	701
25	Asian Option Pricing under Jump-diffusions	703
25.1	Introduction and summary of results	703
25.2	Base examples by Monte Carlo	704
25.3	Developing an integro-differential equation	705
25.4	Formulation as a hitting time problem	706
25.5	Appendix I – Equivalence between two solution forms	709
25.6	Appendix II – some computer code used	710
26	Wiener-Hopf Factorization and the Baxter-Donsker Formula	713
26.1	Examples of Lévy processes in finance	713
26.2	The Wiener-Hopf factorization	714
26.3	The Baxter-Donsker formula	714
	References	721
